Let's cut to the chase. There's a ream of paper here for you to look over, and a lot of statistics, but the summary is as follows:

I think we will wind up with an occupancy of about 67.2% at year end, with a slight improvement in 2010 to somewhere around 69.5% then 71% in 2011 and 72.5% in 2012. About half the impact on occupancy is supply based with a significant increase of 1,729 rooms in 2008 and another 949 coming on line in 2009. The rest of the impact is from a very real drop in demand. Year over year we show a decline of 200,000 room nights from July 2008 to July of 2009 from the prior trailing twelve month period (July 2007 to June 2008). The primary issue here is that almost all of that decline in demand occurred in the first six months of this year. I believe it will be about two years before we recover that lost demand and start off-setting the supply increases as well, that's why we expect occupancies to remain below the 70 percent level through 2010.

Looking at ADR, we were at \$201.92 in 2008. It looks like a \$30 drop in ADR YTD through June, but we think there will be a softening of that by late summer and a net drop of about \$25 from last year to an estimated \$173 for 2009 year end. With recovery, historically we climbed slowly for a year, and then caught momentum, so 2010 is estimated about \$ 183, then \$196 for 2011 and \$207 for 2012.

That's our best guess at this point, and it assumes a late summer bounce back, and a continuous good (doesn't have to be great) stock market performance.

That's coming off the bottom in better shape than the 2001 downturn in terms of occupancy, but only slightly. The RevPAR and ADR drop is significantly more severe. We've had a shift in business mix with more packages, discounts, weekend rates and concessions granted throughout the spring and no sign of let up despite a reasonably firm June and July and an anticipated fair convention season this fall.

There is a strong likelihood that a portion of the national meetings market may be scaled back to regional activity, which tends to generate more local and regional attendance, but fewer room nights. Video conferencing may be incorporated to bring regional sessions together for a portion of the program to continue the national flavor. Nationwide we anticipate a significant shift in convention and meeting activity, with a smaller overall future demand in this segment, partially replaced by leisure travel through tourism and packages. Technology was beginning to impact the convention market in any event, reducing the number of visitors and length of stay as well as reducing booth requirement. This recession has accelerated that evolution in conventions. The drop in attendance is a consequence of the market downturn and recession as well as the impact of technology and represents a dynamic shift or step down in the volume of convention business. Over the next few years we will be able to quantify this impact and the general trend line.

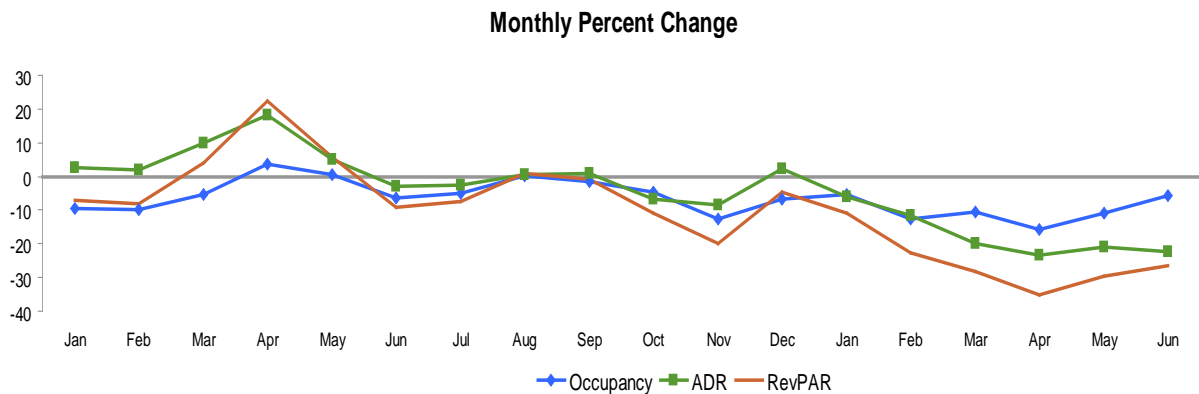

I don't see the Chicago market being hit as severely or for as long a period as our competitors in Las Vegas and Orlando, both of which are suffering through the AIG affect. Chicago, with its superior facilities, variety of venues, lack of distractions and central location is in a good position to serve the evolving meetings market.

In addition to counting on a strong convention market for this fall and a rebounding market in the spring, we expect the infrastructure programs and other incentives to

continue to generate a positive outlook and should result in growth in demand in the next year.

I would be remiss if I didn't comment on year over year comparisons as a basis for evaluating business. The market early last year was very strong, at a level well above average. When we compare a down market early this year with that very strong market early last year the results show a substantial percentage decline in performance indexes. Well, we are now beginning to measure the fall of this year against the fall of last year, when we began to turn downward in performance. Measuring a poor year against another poor period of activity results in much more optimistic comparisons. So we should see that dismal string of double drops in occupancy, rate and RevPAR to turn around this fall, and next year will look great!!!

Here is a chart of the monthly percent change in occupancy, ADR and RevPAR from January of 2008 through June of 2009.

Source: Smith Travel Research

I'll quickly go through the materials included in the package.

The first page of statistics is the projection of Occupancy and ADR for the near term, giving five years of outlook as usual. At the bottom of the page are the critical statistics of demand and supply for the downtown market, showing the drop from a 2008 demand level of 8,232,000 room nights, declining to a forecasted 7,850,000 in 2009

(200,000 of those nights were already lost in the first half of this year). This is matched with supply increases to show the expected occupancy level. The change in supply is a significant factor in the Chicago market area. In 2008 we had an increase in supply of 1,729 rooms, contributing about half the decline in occupancy levels. With another 949 coming on line in 2009 (most of those are already in the market) that will further contribute to the reduced expectation for this year. We have basically discounted the remaining projects as uncertain in timing or uncertain as to status at this time. Obviously new supply past 2010 will continue to impact overall market performance. The listing of supply additions is tabulated and presented on the next page.

Following that are general charts showing the market performance over the past 15 years and an overlay chart of the past three years' and year to date occupancy and rate performance for the downtown market.

We threw in the comparison of supply and demand for the past year and year to date periods to illustrate the loss of room nights from the market, and then wrap it up with a 48 year history of the cycles and patterns in the overall Chicago Metropolitan Area, starting in 1960 so you can visualize the past recessions and recoveries.

Thank You!

I would be pleased to answer questions.
